

Exam Code: 000-667

Exam Name: IBM Test667, Architectural Design of SOA
Solutions.

Vendor: IBM

Version: DEMO

Part: A

1: The SOA reference architecture identifies core services including Interaction, Process, Information, Partner, Access, and Infrastructure. What is one valid reason for excluding one or more of these services in an SOA?

- A.The application is predominantly middleware in nature, eliminating the need for presentation services.
- B.The consumer and the provider belong to different companies.
- C.The business sponsor has set budget constraints on solution architecture and the architectural components to be included have to be prioritized.
- D.The customer's internal politics make the specification too difficult.

Correct Answers: A

2: The IBM SOA Foundation includes services that support business innovation and optimization. What should be found in an SOA deployment compliant with the SOA Foundation?

- A.Automatic recognition of marketplace trends and dynamic reconfiguration of services in support
- B.Tools to help simulate business design and to predict the effect that design changes might have on the business
- C.Alerts generated whenever business efficiency drops below a predefined threshold
- D.An SOA dashboard for executives showing new business opportunities categorized by Return on Investment (ROI)

Correct Answers: B

3: What is the next step while architecting an SOA solution after having just completed documenting the business processes?

- A.Determine the operations required to realize each process
- B.Select a business steward for each process and instruct the steward to identify re-usable services
- C.Identify the services needed to realize each business process and group them into logical components
- D.Identify core and non-core business components

Correct Answers: C

4: A mortgage loan provider currently has legacy applications utilized by a network of branches and franchised agents. They want to expand by adding a new channel to allow independent mortgage brokers to submit mortgage loan applications. They realize they must provide a differentiating offering to the independent mortgage brokers to attract participants and grow the new channel. How can SOA benefit their requirement?

- A.By building an SOA with a secure connectivity layer, they could quickly enable the mortgage broker channel to use their applications without any changes to the legacy system.
- B.They could reduce the cost to develop new applications needed for each independent broker by reusing services as integration code that is written for each broker's system to expedite development.
- C.By service enabling the legacy applications and offering a Web-based portal for independent brokers, they can minimize the impact to existing channels, minimize changes to existing code,

and quickly create an offering for the new channel.

D.By implementing security and governance as part of an SOA deployment, they can control access to the current system to determine which brokers are using the system and personalize their marketing to the high usage brokers.

Correct Answers: C

5: Several design considerations have to be taken into account when designing services in an SOA. Which statement, as applied to those design considerations, is true?

A.Stateless implies that service operation parameters should be allied to the operation semantics.

B.Loose coupling implies that services should be designed using standardized interfaces and with the adoption of open standards.

C.Service granularity implies the service consumer does not hard-code the specific location of the service.

D.Encapsulation implies that services should hide the implementation details from their interface design.

Correct Answers: D

6: A rapidly growing retail company recently outsourced their package delivery to a very reputable package delivery company. The two companies are integrated using SOA and Web services. However, the retail company is having customer satisfaction issues as the call center is not reliably calculating delivery dates. Which portion of the SOA Foundation is the focus to resolve this issue?

A.Information Services

B.Process Services

C.Partner Services

D.Interaction Services

Correct Answers: C

7: A team is evaluating the maturity of a customer's solution architecture relative to the IBM SOA Foundation. It is discovered that the customer has invested heavily in an internally-developed Enterprise Service Bus (ESB) and that their ESB has functionality expected to be found in other SOA Foundation services, especially Process Services, Business Services, and Information Services. Which recommendation should be made?

A.Continue development of the ESB because the architecture is generally compliant with the SOA Foundation

B.Stop development of the ESB because the architecture violates the principle of loose coupling among services

C.Continue using the ESB but begin a transition to a vendor-supported, standards-compliant ESB

D.Stop development because the custom ESB provides almost no Interaction Services

Correct Answers: C

8: How can a designer most effectively integrate components developed in disparate technologies at different companies into a composite application within an SOA?

A.Through careful coordination with all parties to ensure compatible interfaces

B.Through the use of industry standards such as SOAP over HTTPS

C.By placing the components in a service repository which will mediate the differences in their interfaces

D.By providing code mediation and transformation functions through a business process modeling effort

Correct Answers: B

9: A company is using the IBM SOA solution stack to create a new composite application to keep up with the changing marketplace. Functions and data from several existing Enterprise Information Systems (EIS) will be aggregated into the new application using a top-down approach. Which solution is the most appropriate for implementation?

A.Exposing existing applications using multiple adapters

B.Exposing existing systems to heterogeneous clients

C.Exposing existing applications with service components

D.Exposing existing systems with a Web services gateway

Correct Answers: C

10: Two existing applications share common data with each having their own database. Since the data is replicated between the two of them every night, it leads to problems during the day when either application works with potentially outdated data. The customer is considering SOA as a solution. Which SOA approach can most effectively solve this problem?

A.Design a service interface on top of both applications allowing exchange of the shared data in real time

B.Create an information integration layer exposed as services, then re-factor both applications to use those services

C.Consolidate both databases into one and establish proper locking algorithms to ensure data integrity

D.Design a new service that encapsulates the shared data between the two applications

Correct Answers: B

11: The IT organization within a large enterprise is convinced that adopting SOA would significantly improve their response time to business requests for new functionality. Which statement about SOA governance is most likely to be true?

A.The business organization must be educated and convinced that SOA governance will solve their IT operational issues.

B.No additional governance will be required for SOA as implementation only involves IT resources.

C.Management of the introduction of SOA must be incorporated into enterprise governance to be most effective.

D.Business agility can only be achieved by introducing SOA governance at multiple levels within the enterprise organization together with executive sponsorship.

Correct Answers: C

12: The SOA Designer for a large corporation has been assigned the responsibility of defining the services for the purchasing area. The SOA Designer identifies the business needs and background

information from the relevant stakeholder use cases. It is important that 95% of purchasing requests are processed within four hours. Which approach should be followed by the SOA Designer?

- A. Evaluate legacy application systems for relevant functionality and performance
- B. Model the purchasing business process and simulate operations to correctly identify service granularity
- C. Use goal service modeling to understand which candidate services are critical
- D. Interview the stakeholders to find out which business services they would like to expose to business partners

Correct Answers: C

13: A customer wants to create a View Statement Service. Data is stored in VSAM files on System z and the files can be large. The data is archived quarterly, so retrieval time can be significant. Furthermore, the legal view format can change over time. How should the SOA Foundation be utilized to implement the View Statement Service?

- A. Interaction Services to Access Services via Enterprise Service Bus (ESB)
- B. Process Services with JCA to CICS/VSAM
- C. Business Application Services to Access Services via ESB
- D. Business Application Services with JCA to CICS/VSAM

Correct Answers: C

14: The agents of a financial clearing house use several applications that reside in CICS, an application server and a home-grown customer management system. These applications all provide their own interaction services using disparate protocols and UIs. Which pattern is the most appropriate for implementation?

- A. Access the data and functionality using adapters and present the information using JSPs
- B. Create a Swing client to access the refactored application functions which will be wrapped in Web services
- C. Expose the application functionality as services and create a portal for a unified UI
- D. Use the WebSphere Services Gateway to expose the existing systems and integrate the information with a consistent HTML based UI

Correct Answers: C

15: A company has been experiencing a substantially higher load on their online ordering system over the holidays. The assigned Solution Architect has recommended the use of selectors in routing the incoming requests based on market factors. Which important design consideration is being addressed when evaluating the business process aspect of an SOA solution?

- A. Evaluating a number of deployment options for load balancing
- B. Delivery of a consistent user experience under various load conditions
- C. Ability to respond quickly to high value orders
- D. Leveraging information services to improve customer satisfaction

Correct Answers: C

16: In a legacy transformation project an Architect decides to drive CICS transactions using MQ

messages generated by WebSphere Message Broker using a 3270 bridge. What is the advantage of this architecture?

- A.The flow is broken into several legs which means that processing is less complex.
- B.Fewer transactions are required to achieve processing.
- C.The requesting context is already established when the response from CICS is returned.
- D.A wide variety of sources and formats can be routed and transformed as needed.

Correct Answers: D

17: Which issue must be addressed when abstract service definitions are mapped to IT components and are deployed into a runtime environment?

- A.Review of business models and system documentation for the business process in focus
- B.Decomposition of relevant existing systems into process flows, business rules, and potentially reusable components
- C.A choice of architecture alternatives for service implementation
- D.Orchestration of the services into higher level processes

Correct Answers: C

18: At an organization, some standards-based technologies have been adopted around a J2EE application server. There is now a need to provide multi-channel access to existing service providers. Which product should be used for service connectivity in this design?

- A.WebSphere Message Broker
- B.WebSphere Service Registry and Repository
- C.WebSphere ESB
- D.DataPower SOA Appliance

Correct Answers: C

19: A telecom company is trying to capture the business processes that comprise their customer management and provisioning applications. Additionally, they would like to do some process analysis for the purpose of optimizing the interactions between these applications. Which tool, or tools, best fits this situation?

- A.Tivoli Application Dependency Discovery Manager
- B.Rational Software Architect and Tivoli Composite Application Manager
- C.WebSphere Business Modeler
- D.WebSphere Integration Developer and Tivoli Performance Viewer

Correct Answers: C

20: While defining the non-functional requirements for a company, an SOA Architect wants to make use of existing patterns. Which specification should be chosen to address service performance?

- A.Web Service Response Template pattern
- B.Requester Side Caching pattern
- C.Preferred Data Source pattern
- D.Aspect Logging pattern

Correct Answers: B
